Notes: Column (1) and (3) provide the coefficients estimated by maximum likelihood, conditional on s_d/s_x being given by equation (6) and reported in column (6) and reported in columns (2) and (4). All the coefficients reported in column (1) and (2) are statistically different from 0 at the 1% level. Column (3) and (6) report the Vuong (1989) test statistic when comparing a model in which the variance $(\sigma_{zd}^2 + \sigma_{zx}^2)$ is estimated for each country individually against a ‘restricted’ model with a single shape parameter estimated by pooling data for all countries. The latter model is indexed by the subscript r . Entries in bold are those for which the Vuong statistic is greater than 2.58, the critical value for the test at the 1% significance level.
